Excited Delirium Checklist

Excited delirium or excited delirium syndrome is only one form of potential sudden death that law enforcement officers may encounter. Other potential causes of unexpected arrest-related deaths include, but are not limited to: SUDEP\(^1,2\) (sudden unexpected death in epilepsy), sickle cell sudden death,\(^3\) various cardiomyopathies,\(^4\) drug induced arrhythmias (including those caused by alcohol\(^5,6\) and marijuana\(^7-10\)), psychiatric arrhythmias (whether due to schizophrenia\(^11\) or medications\(^12\)), and severe coronary artery disease.

Notes:

A syndrome is an aggregate of signs and symptoms that define a medical condition. Not all persons with a certain syndrome have all the same signs and symptoms. Not all cases of a syndrome result from the same cause. For example, some persons with carpal tunnel syndrome will have numbness and tingling, while others will have weakness and pain. Also, some persons with carpal tunnel syndrome will have it because of trauma, while others will have the syndrome because of pregnancy, diabetes, rheumatoid arthritis or thyroid disease.

Persons with the excited delirium syndrome will have various combinations of some of the signs and symptoms listed above. The cause (etiology) of the excited delirium syndrome in any individual may be due to one or more of a number of conditions. The most common conditions are mental illness and illegal stimulant abuse (especially cocaine and methamphetamine).

Because the term "excited delirium syndrome" has not been widely used until recent years, many physicians do not recognize the term even though they may be very familiar with agitation and deaths due to drugs and other conditions. It is important to avoid the distraction of the various terms that have been applied to this syndrome. For example, what is now referred to as excited delirium \(14-16,26,32,33,36,38-40,44-47,50,53,54,62-69\) or agitated delirium\(41,56,70-115\) has also been called: Bell's mania,\(^30\) acute exhaustive mania,\(^116\) acute delirious mania,\(^30\) delirium grave,\(^30\) typhoma,\(^30\) acute delirium,\(^30\) manic-depressive exhaustion,\(^24\) excited catatonia,\(^89\) lethal catatonia,\(^117\) and neuroleptic malignant syndrome.\(^19,26,43,72,117\)
**Statistical Confidence:**

There must be at least 5 positive criteria to diagnose excite delirium syndrome. For 12 or more positive criteria the confidence level is at least 99.9%. For less than 12 positive criteria the confidence depends on the number of criteria for which information is available.

For example, the brain and hair tests are, unfortunately, typically not done. Often the blood tests for rhabdomyolysis is not done. In this case there will only be information on 19 criteria. If 8 of these 19 criteria were positive then the confidence in the diagnosis would be 93%.
